AIDS and YOUTH

"It is not enough that people are dying
 without the ^{of AIDS} ^{but} ^{no} ^{less} ^{are} ^{the} ^{of} ^{ignorance}"

Sophia Jindal

In today's youth is infected with HIV. HIV
 accounts to recent diagnosis
 the study about that youth of age
 group 18-24 about 44% of youth is
 suffering from HIV. Most of which is
 spreading the fact that they are HIV
 positive.

Disease can be as silent as death.
 Threat on it can be deadliest as
 threatening as AIDS.

AIDS related fear acquired Immune Deficiency
 syndrome can be affected by HIV
 disease. Immune system which usually
 fights the disease system and it is
 most important to have acquired disease
 it disease has resulted in the syndrome
 of group called tuberculosis and HIV results

 (B.T. group)

"YOUTH & AIDS"

"Devotion is better than cure
 especially which has
NO CURE!"

AIDS or Acquired Immune Deficiency
 Syndrome is something which has
 been very long time and it
 has been very long time.

AIDS is caused by HIV or Human
 Immune Deficiency Virus which is
 a retrovirus. This retrovirus contains
 information about the DNA.

History of AIDS:

AIDS was first reported in the year
 1981 in Kansas in the Republic
 of Congo. This disease was discovered
 in a group of homosexual men
 in New York and disease came in
 the year 1981. The evidence about
 the history of AIDS is still unclear.

AIDS and Youth

what is needed to India to an influx of rationality?

It must be wrong to call this generation
 the lost generation - the one which has never seen
 a world devoid of AIDS. However, it is an oblique
 circumstance for some - the name is a common due to
 the confusion for millions all over the world. on the
 internet in the newspapers and the television while
 for some it is a mysterious condition which makes
 them weak and for others only as a part of
 their day to day life it can be understood that it
 is the reality of the era.

Acquired Immune Deficiency Syndrome is the
 name given to the condition of immaturity
 resulting due to the infection of a person with the
 Human Immunodeficiency Virus (HIV). The
 immediate result of this infection is the degeneration
 of a human immune system. This occurs over a period
 of years following which there are opportunistic
 infections which are generally the most severe
 of death. In some of the most virulent cases
 this disease leads to the death of transmission to
 sexual contact or contact with
 infected blood or fluid.
