

## Faculty of Science

### SUBJECT: PHYSICS

#### M.Sc. I Semester

#### Under CBCS System

#### Paper-I

### MATHEMATICAL PHYSICS

### Course Outcomes

	Course Outcomes	Cognitive Level
CO-I	The Learner will understand Special functions, such as Hermite, Legendre and Laguerre polynomials and Bessel functions	U
CO-II	The Learner will use Fourier transform, inverse Fourier transform, Laplace transform, inverse Laplace transforms & their properties. They will make use of Laplace transform to solve physical problems	U, Ap, An
CO-III	The Learner will construct Green Function and apply it to solve non homogeneous differential equations	U, Ap, An, C
CO-IV	The Learner will recognize and use Complex numbers, their functions and properties. They will apply Residue theorem in evaluating definite integrals	R, U, Ap, E

# ST. ALOYSIUS COLLEGE(AUTONOMOUS), JABALPUR

Reaccredited 'A+' Grade by NAAC(CGPA:3.68/4.00)

College with Potential for Excellence by UGC

DST-FIST Supported & STAR College Scheme by DBT

## Content of the Course

### Theory

No. of Lectures (in hours per week): 4.5 Hrs. per week

Total No. of Lectures: 60 Hrs.

Maximum Marks: 40

Units	Topics	No. of Lectures
I	Differential equations: Recursion relation, generating functions and orthogonality of Bessel functions of first and second kind, Hermite, Legendre, Associate Legendre and Laguerre Polynomials. Curvilinear co-ordinate system with specific cases of Cartesian, Cylindrical, and Spherical coordinate systems.	12
II	Integral transforms. Fourier integral. Fourier transform and inverse Fourier transforms. Fourier transform of derivatives. Convolution theorem. Elementary Laplace transforms. Laplace transform of derivatives. Application to a damped harmonic oscillator.	12
III	Green's functions: Non-homogenous boundary value problems, Green's function for one dimensional problems, eigen function expansion of Green's function, Fourier transform. Method of constructing Green's function, Green's function for electrostatic boundary value. Problems and quantum-mechanical scattering problem.	12
IV	Complex variables: Analyticity of complex functions. Cauchy Riemann equations. Cauchy theorem. Cauchy integral formula. Taylors, Maclaurin, Laurent series & mapping. Theorem of residues. Simple cases of contour integration. Jordan's lemma Integrals involving multiple valued functions(Branch points).	12
V	This unit will have questions covering all the four units. In addition to the problems given below the unit will consist of problems given in Text / Reference books. <ol style="list-style-type: none"><li>1. Green's function for a linear oscillator, Green's function and the Dirac <math>\delta</math>-function, finding Green's function for Linear operators in 1-D.</li><li>2. Potential due to discrete or continuous charge distribution; vibration of a circular membrane, solving the 1-D harmonic oscillator Schrodinger equation; Relation of the hydrogen atom, Schrodinger equation with Laguerre equation and solution.</li><li>3. Solution of initial value problems by using Laplace transform; LT and inverse LT of various functions,</li></ol>	12

## M.Sc. I Semester

### Paper-II

#### CLASSICAL MECHANICS

##### Course Outcome

	Course Outcomes	Cognitive Level
CO-I	earner will understand Newtonian, Lagrangian and Hamiltonian formulations of classical mechanics and apply in appropriate physical problems.	U, Ap
CO-II	earner will understand the equations of canonical transformation and generating functions. Poisson's brackets and its applications	U, R, E, C
CO-III	earner will define and simplify the Small oscillation problems.	U, R, An
CO-IV	earner will understand and recapitulate the special theory of relativity and their postulates. Elaborate 4- vectors and 4 – scalars, Covariant Lagrangians and Hamiltonians	U, C

## Content of the Course

### Theory

No. of Lectures (in hours per week): 4.5 Hrs. per week

Total No. of Lectures: 60 Hrs.

Maximum Marks: 60

Units	Topics	No. of Lectures
I	Newtonian mechanics of one and many particles systems: Conservation laws, Constrains their classification, Principle of virtual work; D'Almbert's principle in generalized coordinates, The Lagrange's equation from D'Almbert's principle. Configuration space, Hamilton's principle deduction from D'Almbert's principle, Generalized momenta and Lagrangian formulation of the conservation theorems, Reduction to the equivalent one body problem; the equation of motion and first integrals, the differential equation for the orbit	12
II	The equations of canonical transformation and generating functions; The Hamilton-Jacobi Action and Angel variables. Poisson's brackets; simple algebraic properties of Poisson.s brackets. The equation of motion in Poisson's Brackets notation. Poisson theorem; principle of least action. The Kepler problem, Inverse central force field, Rutherford scattering.	12
III	Theory of small oscillations, Equations of motion, Eigen frequencies and general motion, normal modes and coordinates, Applications to coupled pendulum and linear bistable molecule. Rotating coordinate systems. Acceleration in rotating frames. Coriolis force and its terrestrial astronomical applications, Elementary treatment of Eulerian coordinates and transformation matrices. Angular momentum inertia tensor. Euler equations of motion for a rigid body. Torque free motion for a rigid body.	12
IV	Symmetries of space and time. Invariance under Galilian transformation, Covariant four dimensional formulation, 4 -Vectors and 4 - scalars. Relativistic generalization of Newton's laws, 4 - momentum and 4 - force, variance under Lorentz transformation relativistic mechanics. Covariant Lagrangian, covariant Hamiltonian, Examples.	12
V	This unit will have questions covering all the four units. In addition to the problems given below the unit will consist of problems given in Text / Reference books.	12

## M.Sc. I Semester

### Paper-III

#### DIGITAL ELECTRONICS & ELECTRONIC DEVICES

##### COURSE OUTCOME

	Course Outcomes	Cognitive Level
CO-I	The Learner will understand the Techniques of simplification of digital circuits	R,U,An
CO-II	The Learner will understand Operational amplifiers and their use in various applications in various logic circuits.	U, Ap ,C
CO-III	The Learner will understand and explain various Metal oxide semiconductors JFET, MOSFET, MESFET,	U, An
CO-IV	The Learner will understand and apply Microwave devices such as Tunnel, IMPATT and Gunn Diodes.	R , U , E,Ap
CO-V	The Learner will understand and recall Various Photonic devices and their I-V characteristic curve.	U,Ap,E
CO-VI	Learner will understand and use Op-Amp, and compare I-V characteristic curves of FET, Tunnel, LED,etc.	U, An,C

## Content of the Course

### Theory

No. of Lectures (in hours per week): 4.5 Hrs. per week

Total No. of Lectures: 60 Hrs.

Maximum Marks: 40

nits	Topics	No. of Lectures
I	<p><b>Digital Electronics:</b> Number systems (decimal, Binary, Octal, hexadecimal) and their conversion, Logic Gates: AND, OR, NOT, NAND, NOR, EX-OR (Truth table, Boolean expression, symbol), diode and transistor as logic gate, laws of Boolean algebra, K-map, De Morgan's theorem.</p> <p><b>Bistable Circuits:</b> RS Flip-flop, clocked RS Flip flop, Edge trigger Flip flop, D Flip flop Preset and clear.</p>	12
II	<p><b>Operational Amplifiers:</b> DC Amplifier, Difference amplifier, Op-Amp symbol, OP-AMP Parameters: Input bias current, Input offset current, Input offset voltage, Open loop gain, CMRR, Slew Rate, Concept of virtual ground, summing point, ideal Op-Amp.</p> <p><b>Application of Op-Amp:</b> Inverting and Non-Inverting modes of Op-Amp, Use of OPAMP as adder, subtractor, differentiator, integrator, IC 741 as Op-Amp.</p>	12
III	<p><b>Transistors:</b> Junction Field Effect Transistor (JFET); Physical Structure, Principles of Operation, Metal Oxide Semiconductor Field Effect Transistor (MOSFET); Physical Structure, Electronics Mechanism, Mode of Operation, and Metal-Semiconductor Field-Effect-Transistors (MESFET); Physical Structure, Principles of Operation, derivations of the equations for I-V characteristics under different condition.</p> <p><b>Microwave devices:</b> Tunnel diode, Transfer electron devices (Gunn diode), Avalanche transits time devices, Impatt diodes and Parametric devices.</p>	12

**M.Sc. I Semester**  
**Paper-IV**  
**COMPUTATIONAL METHODS AND PROGRAMMING**

**COURSE OUTCOME**

	Course Outcomes	Cognitive Level
CO-I	he student will understand various aspect of 'C' Programming.	U, Ap, C
CO-II	The student will understand and Solve and determine zero of linear and non-linear equations using different methods.	U, R, Ap ,C, An
CO-III	he student will understand and determine Eigen values and Eigen vectors of matrices using different methods.	U, Ap, An
CO-IV	he student will understand and define Interpolation and various methods for interpolation.	R , U , Ap , E
CO-V	he student will understand and evaluate numerical solutions of ordinary differential equation.	U, E

## Content of the Course

### Theory

No. of Lectures (in hours per week): 4.5 Hrs. per week

Total No. of Lectures: 60 Hrs.

Maximum Marks: 40

Units	Topics	No. of Lectures
I	<b>Introduction to C:</b> Data type (int, float, double, char, long, long double etc.) operators (Unary.Binary and ternarys), input /output statement (scanf(), printf()), control statements (if, for, while, do while, switch -case-default), Function (type of Function, function definition, function calling, formal arguments, actual arguments, function prototype), Program structure, string (Array, character array), string manipulation functions like strlen(), strcpy(), strcat(), strcmp(), etc.	12
II	<b>Method for determination of zeros:</b> linear and non-linear algebraic equation and transcendental equations using bisection method, false position method and Newton Raphson method, convergence of solutions, solutions of simultaneous linear equation, Gaussian elimination method, pivoting, iterative method, Matrix inversion.	12
III	<b>Eigen Value and Eigen Vectors of Matrices:</b> Power and Jacobi method, finite difference interpolation with equally and unequally spread points, curve fitting, polynomial least squares and cubic spline fittings. Numerical differentiation and Integration, Newton-Cotes Formulae, error estimates, Gauss-Method.	12
IV	<b>Interpolation:</b> Lagrange's Interpolation, Finite difference and operators, Newton forward, Newton backward, Gauss forward, Gauss backward, Stirling's interpolation divided difference formula.	12
V	<b>Numerical solution of ordinary differential equation :</b> Euler and Runge-Kutta Methods, predictors and corrector method. Introduction to partial differential	12

	equations & their classification. Solution of Laplace Equation by Finite Difference Method. Random variables, Monte Carlo evaluation of integrals

### Paper-II

### STATISTICAL MECHANICS

#### COURSE OUTCOME

	Course Outcomes	Cognitive Level
COU -I	Learner will be able to outline the basic concepts of statistical mechanics	U, R
COU -II	Learner will be able to classify and compare the combinational studies of particles with their distinguishably and indistinguishably. (Maxwell-Boltzmann, Bose-Einstein and Fermi-Dirac distribution laws)	U, Ap, An
COU -III	Learner will be able to apply the Quantum statistical mechanics for Cluster Expansion	U, Ap, An
COU -IV	Learner will be able to develop a molecular-level understanding for transitions (as in magnetism) and to solve it using different (mean-field) approximations	U, C, Ap, E
COU -V	Learner will have an understanding of the importance of Non-equilibrium aspects in a physical system	U,C

## Content of the Course

### Theory

No. of Lectures (in hours per week): 2 Hrs. per week

Total No. of Lectures: 60 Hrs.

Maximum Marks: 40

Units	Topics	No. of Lectures
I	Foundation of statistical mechanics, specification of states of a system contact between statistics and thermodynamics, classical ideal gas entropy of mixing and Gibb's paradox. Microcanonical ensemble, phase space, trajectories and density of states, Liouville theorem, canonical and grand canonical ensembles, partition function, calculation of statistical quantities, energy and density fluctuations.	12
II	Statistics of ensembles, statistics of indistinguishable particles, density matrix, Maxwell Boltzmann, Fermi Dirac and Bose- Einstein statistics, properties of ideal Bose gases, Bose Einstein condensation, properties of ideal Fermi gas, electron gas in metals, Boltzman transport equation.	12
III	Cluster expansion for a classical gas, virial equation of state, mean field theory of Ising model in 3, 2 and 1 dimension. Exact solution in one-dimension.	12
IV	Thermodynamics fluctuation spatial correlation Brownian motion, Langevin theory, fluctuation dissipation theorem, the Fokker-Planck equation, Onsager reciprocity relations	12
V	This unit will have questions covering all the four units. In addition to the problems given below the unit will consist of problems given in Text / Reference books.  (1) Calculation of number of states and density of states. (2) Relative population of particles in two energy levels. (3) Liquid helium II (4) Electrical and thermal conductivities. (5) Evaluation of virial coefficient	12

	(6) Critical indices.	
	(7) Applications of Onsager relation	
	(8) Diffusion co-efficient

### Paper-III

### ELECTRODYNAMICS & PLASMA PHYSICS

#### COURSE OUTCOME

	Course Outcomes	Cognitive Level
COU-I	earner will have an insight of the basics of electrostatics and magnetostatics, Maxwell's equations	U, R, Ap
COU-II	earner will understand the Four vector and Lorentz transformation in 4-dimensional spaces	U,C, An, R
COU-III	earner will understand and will be able simplify Langragian and Hamiltonian for a relativistic charged particle in External EM field	U, An, R, Ap
COU-IV	Learner will have an insight of the concept of plasma and will be able to differentiate between gaseous and solid state Plasma	U, C, E

## Content of the Course

### Theory

No. of Lectures (in hours per week): 2 Hrs. per week

Total No. of Lectures: 60 Hrs.

Maximum Marks: 40

Units	Topics	No. of Lectures
I	Review of Basics of electrostatics and magnetostatics, electric field, Gauss's law, Laplace and Poisson equations, method of images, Biot-Savart law, Ampere law, Maxwell's equations, scalar and vector potentials, gauge transformation, Lorentz gauge, Coulomb Gauge, Solution of Maxwell equations in conducting media radiations by moving charges, retarded potentials, Lienard-wiechert potentials, fields of charged particles in uniform motion, fields of arbitrarily moving charge particle.	12
II	Fields of an accelerated charged particles at low velocity and high velocity, angular distribution of power radiated, Review of four vector and Lorentz transformation in 4-dimensional spaces, Invariance of electric charge, relativistic transformation properties of E and H fields. Electromagnetic fields tensor in 4- dimensional Maxwell equation, Four Vector current and potential and their invariance under Lorentz transformation, covariance of electrodynamics. Langragian and Hamiltonian for a relativistic charged particle in External EM field; motion of charged particles in electromagnetic fields, uniform and nonuniform E and B fields.	12
III	Elementary concept of occurrence of plasma. Gaseous and solid state plasma. Production of gaseous and solid state plasma. Plasma parameters. Plasma confinement pinch effect instability in a pinched- plasma column. Electrical neutrality in a plasma. Debye screening distance. Plasma oscillations: Transverse oscillations and longitudinal oscillations.	12
IV	Domain of Magnetohydrodynamics and plasma Physics : Magnetohydrodynamic equations, magnetic hydro-static pressure hydrodynamic waves: Magneto-sonic and Alfvén waves, particle orbits and drift motion in a plasmas, Experimental study of Plasma, the theory of single and double probes.	12
V	This unit will have questions covering all the four units. In addition to the problems given below the unit will consist of problems given in Text / Reference books.	12

# ST. ALOYSIUS COLLEGE(AUTONOMOUS), JABALPUR

Reaccredited 'A+' Grade by NAAC(CGPA:3.68/4.00)

College with Potential for Excellence by UGC

DST-FIST Supported & STAR College Scheme by DBT

- (1) Obtain the formal solution for electromagnetic boundary value problem with Green function.
- (2) Discuss the problem of conducting sphere is a uniform electric field by method of images and Green's functions.
- (3) For a solenoid wound with  $N$  turns per unit length and carrying a current  $I$ , show that the magnetic flux density on a point on the axis is given (for  $N \rightarrow \infty$ ) by

$$B_z = \frac{2\pi NI}{C} (\cos \theta_1 + \cos \theta_2)$$

Where  $\theta_1, \theta_2$  are the angles between the axis and the lines joining the point on the axis to the first and last turns of the solenoid.

- (4) A linear accelerator accelerates protons to almost relativistic speeds. Determine fraction of power radiated by the protons to the power supplied in terms of the gradients of the linear electric field.
- (5) A charged particle oscillated according to the harmonic law Determine the total average intensity of the emitted radiation.
- (6) Discuss the Lagrangian and Hamiltonion for a relativistic charged particle in External electromagnetic field.
- (7) Obtain the expression for energy radiated as Cherenkov radiation per unit distance along the path of the particle.
- (8) Consider a magnetic field configuration that is cylindrically symmetric and a charged particle is injected into it. Use the adiabatic invariant of motion to describe conditions in which the injected particle would bounce back from the direction of increasing field gradient.
- (9) Consider the problem of waves in an electronic plasma when an external magnetic field  $B_0$  is present. Use the fluid model, neglecting the pressure term as well as collisions.
  - (a) Write down the linearized equations of motion and Maxwell equations, assuming all variables vary as  $\exp(ik \cdot x - i\omega t)$ .
  - (b) Show that the dispersion relation for the frequencies of the different modes in terms of the wave number can be written.

$$\omega^2(\omega^2 - \omega_p^2) (\omega^2 - \omega_p^2 - k^2 c^2) = \omega_B^2 (\omega^2 - k^2 c^2) [\omega^2 (\omega^2 - \omega_p^2 - k^2 c^2) + \omega_p^2 c^2 (k \cdot b)^2]$$

where  $b$  is the unit vector in the direction of  $B$ ,  $\omega_p$  and  $\omega_B$  are the plasma and precession frequencies, respectively.

- (c) Show that for propagation parallel to  $B_0$  the dielectric constant is recovered.
- (d) Assuming  $\omega_B \ll \omega_p$ , solve approximately for the various roots for the cases
  - (i)  $K$  parallel to  $b$
  - (ii)  $K$  perpendicular to  $b$ . Sketch your result for  $w^2$  versus  $k^2$  in the two cases.

### Paper-IV

## CONDENSED MATTER PHYSICS

### COURSE OUTCOME

	Course Outcomes	Cognitive Level
COU-I	The Learner will have an understanding of Interaction of X-Ray with matter and Crystal Defects	U, R
COU-II	Learner will have an insight into the concept of Free electron Fermi gas, Energy bands and band theory	U, Ap, C
COU-III	Learner will have an insight into the phenomena of Super conductivity	U, An, R
COU-IV	Learner will be able to classify atomic and molecular polarizability and its related phenomena	U, E
COU-V	Learner will be able to explain the Theories of Ferromagnetism	U, R, AP

## Content of the Course

### Theory

No. of Lectures (in hours per week): 2 Hrs. per week

Total No. of Lectures: 60 Hrs.

Maximum Marks: 40

Units	Topics	No. of Lectures
I	<p>Interaction of X-ray with matter, absorption of X-rays, Elastic scattering from a perfect lattice. The reciprocal lattice and its application to diffraction techniques, the Laue, power and rotating crystal methods. Crystal structure factor and intensity diffraction maxima. Extinction due to lattice centering.</p> <p>Point defects, line defects and planer (stacking) faults. The role of dislocation in plastic deformation and crystal growth. The observation of imperfections in crystals. X-ray and electron microscopic techniques</p>	12
II	<p>Free electron Fermi gas, Energy levels of orbital in one and three dimensions. Electrons in a periodic lattice. Bloch theorem, band theory of solids, Classification of solids effective mass. Tight binding, cellular and pseudopotential methods. Fermi surface. De Hass von Alfen effect, Super conductivity, critical temperature persistent current. Meissner effect, general idea about high temperature superconductors</p>	12
III	<p>Atomic and molecular Polariziblity, Claussius-Mossotti relation, types of polarzibility, dipolar polarizibility and frequency dependence of dipolar polarizibility, ionic and electronic polarizibilty, Hall effect. Quantum Hall Effects, Magnetoresistance.</p>	12
IV	<p>Weiss Theory of Ferromagnetism. Heisenberg model and molecular field theory, spin waves and magnous, Curie-waves law for susceptibility, ferri and anti-Ferro-magnetic order. Domains and Bloch-wall energy.</p>	12
V	<p>This unit will have questions covering all the four units. In addition to the problems given below the unit will consist of problems given in Text / Reference books.</p> <p>(1) Given that the primitive basis vectors of a lattice <math>a = (a/2)(i + j)</math>, <math>b = a/2(j + k)</math> and <math>c = a/2(k + j)</math> where <math>i, j</math> and <math>k</math> are usual three unit vectors along cartesion coordinates. What is the Bravais lattice?</p>	12

	<p>(2) Determine planes in a fcc structure having highest density of atoms. <i>Or</i> Evaluate density of atoms for Cu in atoms/cm<sup>2</sup>.</p> <p>(3) For the delta function potential and with <math>p &gt; 1</math> find at <math>k = 0</math> the energy of the lowest energy band. Also find the band gap at <math>k = \pi/a</math>.</p> <p>(4) Consider a square, lattice in two dimensions with the crystal potential. <math>U(x,y) = .4U \cos(\pi x/a) \cos(\pi y/a)</math> Apply the central equation to find approximately the energy gap at the corner point <math>(\pi/a, \pi/a)</math> of the Brillouine Zone.</p> <p>(5) Explain why the Hall constant is inversely proportional to the electro concentration M.</p>

## References

### Test/Reference Books:

1. . Kittle : Solid State Physics
2. Aschroft & Mermin : Solid State Physics
3. L.V. Azaroff : Introduction to Solid State Physics
4. Verma & Srivastava : Crystallographic Solid State Physics
5. A.J. Dekker : Solid State Physics
6. P.M. Chaiken & T.C. Lubensky: Principles of Condense Matter Physics

## M.SC. (PHYSICS) I & II SEMESTER: PRACTICAL

**Note: Appropriate other experiments can be added based on prescribed syllabus in both labs A and B**

### LAB : A

#### Miscellaneous Topics in Optics I & II

(Preferably Five experiments per semester to be performed by the students)

1. Determination of the Wavelength of the LASER Light source using plane Transmission Grating.
2. Determination of Separation Between Two Plates of Fabry Perot Etalon with the help of He- Ne Laser.
3. Determination of the radius of Curvature of Plano- convex Lens by Newton's Ring Method .
4. Determination of Wavelength of Spectral Line by Constant deviation Spectrograph.
5. Determination of Refractive index of the material of the prism By Using Spectrometer And Laser And Plotting  $i-\delta$  Curve.
6. Sodium Light Determination of the Wavelength of the Source Fresnel's Biprism.
7. To Find the Brewster's angle of the Prism using Spectrometer and Polarizer.
8. To Find the Refractive Index of Water and to Study the variation of Refractive index With Wavelength of the Light Source.
9. To Find the Refractive index of Sugar Solution and to Study the Variation of the Refractive index with difference molar Concentration.
10. To measure the LASER beam divergence using Photo Sensor by Plotting the distance vs. current graph.
11. To Determine the Elastic constant of acrylic beam by Cornu's method.
12. To determine the Wavelength of the of the LASER Light Source using Plane Transmission grating.
13. Optical Fiber : (a) Determination of numerical aperture (b) Attenuation Loss (c) Bending loss.
14. Production and study of elliptically and circularly polarized light by Fresnel's Rhomb.
15. Verification of Hartman's formula by constant deviation spectrometer.
16. Verification of Fresnel's law of reflection for polarized light.

## M.SC. (PHYSICS) I & II SEMESTER: PRACTICAL COURSE

**Note: Appropriate other experiments can be added based on prescribed syllabus in both labs A and B**

### LAB –B (ELECTRONICS –I & II)

(Preferably Five experiments per semester to be performed by the students)

- (1) To study IV Characteristics of LED of different colour and determination of their threshold voltage and wavelength.
- (2) To verify the De'Morgans theorem using the Logic gate.
- (3) Design of a regulated power supply using IC78XX(7805,7809,7812).
- (4) To study the truth table of RS Flip flop.
- (5) To study the truth table of JK Flip flop.
- (6) To verify truth table of NOT, AND, NAND, OR, NOR, Ex-OR using IC 74XX series.
- (7) To design half adder using 74XX series IC.
- (8) To design and study Astable multivibrator.
- (9) To design a differentiator using IC 741 on multisim software and get different waveform for different input.
- (10) To design a integrator using IC 741 on multisim software and get different waveform for different input.
- (11) Design of a regulated power supply using IC78XX(7805,7809,7812) in multisim software.
- (12) To design a adder and subtractor using IC 741 on multisim software/ IC74XX.
- (13) To design and study Butterworth High pass filter using IC 741 in multisim
- (14) To design and study Butterworth Low pass filter using IC 741 in multisim
- (15) Study of Astable, Monostable and bistable Multivibrator using IC 555.
- (16) Characteristics and application of Silicon controlled Rectifier.
- (17) Experiment on FET and MOSFET characterization and application as an amplifier.
- (18) Experiment an UJT and its applications.

## Credit and Marking Scheme

	Credits	Marks		Total Marks
		Internal	External	
<b>Theory</b>	4	10	40	<b>50</b>
<b>Practical</b>	2	10	40	<b>50</b>
<b>Total</b>	<b>6</b>	<b>100</b>		

## Evaluation Scheme

	Marks	
	Internal	External
<b>Theory</b>	Test+ Presentation	1 External Exams (At the End of Semester)
<b>Practical</b>	Internal Exams (During the Semester)	1 External Exams (At the End of Semester)
